

NiceRink Backyard Ice Rink Brackets

Enough brackets (30 to 34) for a 20' x 40' rink for **\$50**

(Retail for over \$300)

NiceRink brackets are the most unique and easiest method ever devised to make the perimeter of an **outdoor, temporary ice rink**. So unique in fact, they're patented. The NiceRink™ brackets were designed and engineered based on the knowledge they've gained from building and skating on their own outdoor rinks using the traditional sideboard and pounded stake method. The NiceRink™ brackets eliminate the need to "build" a rink. They are easy to use and cut installation time by at least half. With that in mind, they know you'll enjoy the practical purpose and clean esthetic look of the bracket's design on your NiceRink. The NiceRink brackets spaced every 4' are designed to accommodate 3-14" of ice with no additional support needed. This is accomplished by using 3/4" thick plywood in variable height panels of 12", 16" or 24" as required by your rinks location, design and how the rink will be used. The ability to adjust the board height makes it easier to erect a rink on uneven or sloping ground. The minimum board height is 8" with a maximum suggested height without additional support of 24". This allows for as much as a 10" pitch (14" of ice) using the **NiceRink backyard ice rink brackets** alone.
